Hello,

I have DICOM files that I want to read with IDL. These files come from a Philips scanner and have 2 images per files. When I get X and Y images dimensions tab, I get for example :

tabX = [512, 64]

tabY = [512, 64]

but when I retrieve image at image_index=0, I get a 64x64 image instead of a 512x512 one ! Is it a bug in my scanner, or is it DICOM standard which specify that image_index is inverted compared to indexes in images dimensions array ? Thanks,

JB
