Do you mean you want the map projection to be the plot background, and you just want to plot over it (without erasing it) ??

Maybe you can use the Z-buffer (same method used to overplot surfaces, surface+contour, etc). Only problem then is you're restricted to the crappy screen fonts for output.

Do you need this plot for a presentation/document? If so I would just let IDL do what IDL does best and plot the data. I would then save it as a PS file (great fonts), convert it to a transparent gif(or png), and then simply import it over my map of the world image in the final application (e.g. Powerpoint or Word, or Photoshop, etc.)

The above (if it's at all what you need) may sound complicated, but it would take me about, oh, maybe an hour total (including figuring-it-out time). Doing everything in IDL via object graphics would take me at *least* a week. :o)
