Subject: An ENVI question (sigh)
Posted by Mort Canty on Wed, 28 Sep 2005 11:00:44 GMT

Hi all,

I know that ENVI experts are pretty sparse in this group, but I'm desparing (again). I posed this question here some time ago without success, but maybe someone can help now.

In ENVI version 3.6 the classification "rule image" was changed from being an array of pixel class membership probabilities to "something else". That "something else" is described nowhere, save in an RSI Tech Tip, article No. 1793

http://www.rsinc.com/services/techtip.asp?ttid=1793

by someone that unfortunately doesn't know the difference between a covariance matrix (Greek Sigma) and a summation symbol! (So you see why I despair).

Has _anyone_ managed to find out precisely what the numbers mean that are stored in ENVI rule image arrays?

Many Thanks

Mort Canty
