Hi all!

My question is about the McIDAS area conversion to HDF file. I get the MODIS data via McIDAS. In order to process the MODIS data (remap, bowtie correction, etc) I have to rebuild the original hdf file. Here comes my problem. How can I gather all my ASCII files (from McIDAS), the latitude, longitude, bands, etc, in one file as original one (with correspondent SDS)?

Regards,

Oana Nicola
