
Subject: get_kw_params in V4.0 - what's changed?

I have a FORTRAN routine that calls get_kw_params which is LINKIMAGE'd into IDL (VAX VMS version). The routine works fine under V3.6 but fails with an access violation under V4.0. I have already made modifications to handle the increase in size of IDL variables from 10 to 18 bytes.

Does anyone know what has changed with this routine? RSI says the internals docs won't be ready for 5 weeks. I'd rather not wait that long. Trying to get an answer from them is like communicating with someone from Alpha Centauri!

Any help would be greatly appreciated.
