Hi Francois,

try

```
IDL> a=[1,2,3,4]
```

```
IDL> b=fix(strjoin(strcompress(string(a),/rem)))
```

```
IDL> print, b
```

```
1234
```

So, string(a) makes a 4-element array of strings, strcompress(/rem) removes all blanks from the individual strings, strjoin() puts them all together into one, and finally fix() converts the one string into a number.

Cheers,

Peter
