
Subject: POLAR_CONTOUR 'PS' Bug?

I am using IDL4.0 on an MS Windows 3.1 machine with 8 MB of RAM and 150 MB spare hard-disk space. Has anyone found any bugs when using the new POLAR_CONTOUR procedure? The /FOLLOW and /DOWNHILL keywords do not seem to work with this procedure. When using the 'WIN' device for displaying the plots correct results are obtained using POLAR_CONTOUR, but when using the 'PS' device the plots are often corrupted. I have sent the files to three laser printers and in all cases there are offending errors. I have used the program GHOSTSCRIPT to display the 'PS' files and the errors are clearly seen in the images. Does anyone know the solution to this problem? Is the bug in IDL or is it some formatting problem with my P.C.?
