
Subject: Reading UUID from JPEG2000 file

Good day,

Hopefully there is someone here who knows this.

I had converted a GEOTIFF picture to JPEG2000 using the ENVI program.
Is there any documentation or information on the structure definition
for UUID for the jp2 file with GEOTIFF UUID box? The help section in
IDL doesnt provide me any detail information on UUID especially reading
the geometry information.

Thanks in advance.
KK
