I want to be able to read .wav audio files in IDL, such that after
stripping the header I can look at the actual values. I can't find a
website with the actual binary format of wav files explained. I
remember doing something like this years ago. I read wav files and
then displayed them and processed them etc (I was comparing wav files
before and after being sent VOIP) - just cant remember how I did it. I
was also using PV-WZVE before which may have had a wav file reader?

thanks

russ
