I have been running Windows IDL 3.6.1 without any difficulty for several months. I have 90 MHz Pentium w/ 32 megabyte memory and ample disk space. The new version (IDL 4.0) installs without problems but simply will not initialize the !DIR and !PATH system variables when it starts up. Does anyone know what is wrong or has anyone else seen this problem? IDL support has walked me through all the obvious things on the phone but they don't know how to solve it. I think they have given up.
