Subject: subscripting arrays

Hi all,

this is probably simple, but I can't figure it out right now:

I want to extract an element from a 2d array, and I have the 2d subscripts of that element available as a 2-element vector.

IDL> a = dist(300) IDL> b = [30, 50] IDL> print, a[b] 30.0000 50.0000

Not what I want. What I want is

IDL> print, a[b[0], b[1]] 58.3095

Is there a more elegant way than splitting b up?

Thanks, Benjamin
