Dear all,

I just want to allocate data(computed in each loop step) to different array in each step.

for example,
while ...

..
..
data=...

a0=data
.
.endwhile

in other words
loop step 1: a1=data
loop step 2: a2=data
loop step 3: a3=data
.
.end of loop

I need new array on each step but I can not know the size of array(data computed)and number of steps in advance.
It would be different on each step.

To sum up,
I need the generation of array(different name ex) a0,a1,a2....)on each loop step.

Thank you.

Help me~ You can give a bright to a blind(IDL blind like me ^^;).
SOS~~
