There is pry a tutorial or something out there that I am overlooking, but here is the situation I'm in.

I have written an IDL application that spans approximately 10 interconnected programs/functions, and I want to compile a .sav file. I developed these files in good old Kate, and the IDL command prompt. The heart of my question is how do I create a .sav from the command line? How do I use the full IDL version to run the virtual machine (can I)? Any other suggestions would be appreciated. Thanks in advance.

Regards,

Alunduil
