Subject: combining many files with the same format into one file
Posted by houhou on Thu, 22 Dec 2005 00:43:07 GMT

Hello, everyone, I am new to IDL and I have a simple(?) question. I have many ascii files (50) with the same format and I would like to combine them into one file. How should I do it? In each file, each line has 6 variables with the first one is the plot number. for the same plot, the first line is the mean value for each variable and the second line is the standard deviation for the variables. The following is an example of the file:

```
 612      50.294046      34.531883      0.23375815
22.902172       31.764285
 612    0.077608618     0.18311485    0.0028922797
0.39409960      0.16652671
 504      48.132000      34.148000      0.19627400
24.366400       30.625900
 504     0.00000000     0.12934367    0.0092095361
0.40677598      0.24797775
........
```

Thanks.
