
Subject: Problem Compiling and Using Functions

I'm having trouble getting simple functions to work. I have the code below in a single file named extract_tiles.pro. When I try and compile it gives me a syntax error on the line containing "extract_tiles_get_tile(fid)" in the extract_tiles procedure. If I change the function to a procedure, comment out the return statement and change the function call to a procedure call it works perfectly.

It's probably a simple error, but I can't figure it out. I'm using IDL 5.6 and ENVI 3.6.

```
FUNCTION extract_tiles_get_tile, fImg
ENVI_FILE_QUERY, fImg, ns=ns, nl=nl
print, 'Samples: ', ns
print, 'Lines: ', nl
RETURN, 0
END
```

```
PRO extract_tiles
ENVI_OPEN_FILE, 'image.dat', r_fid=fid
extract_tiles_get_tile(fid)
END
```

Thanks,
Mike
