Thanks a lot for your help.. I've just removed my post because I received many spams due to my e-mail address explicit on top of the message (nickname); now at least I changed my nickname. Maybe it was useless, but anyway, it's still quoted in your post. (oh, I've just read the remark on top of this page: "The group you are posting to is a Usenet group. Messages posted to this group will make your email visible to anyone on the Internet." So, no way of escaping spams..)

I've read the your articles. Those have given me insight, thank you.. Finally I've accomplished it by forgetting about displaying the image, and considering contours with /cell_fill option. What I did is just "map_set" and then "contour" directly, with choosing the levels and the corresponding colors from the color table which were loaded by "loadct". Everything works well with multiple plots, too.

Greetings,
