Possibly the build in screencapture:

usage: screencapture [-icmwsWx] [files]
-i capture screen interactively, by selection or window
control key - causes screen shot to go to clipboard
space key - toggle between mouse selection and
window selection modes
escape key - cancels interactive screen shot
-c force screen capture to go to the clipboard
-m only capture the main monitor, undefined if -i is set
-w only allow window selection mode
-s only allow mouse selection mode
-W start interaction in window selection mode
-x do not play sounds
-S in window capture mode, capture the screen not the window
-C capture the cursor as well as the screen. only in non-interac-
odes
-t<format> image format to create, default is png
files where to save the screen capture, 1 file per screen

might serve better for this purpose

Karsten
