Hi Michael,

thanks for your reply. I had been seen you are the most java questioner of the group :)

Well, it is very strange problem. I have executed the program for a long time in a machine (at work) and all is right (no memory leaks and hotspot doesn't crash).

When I move the program to the clients machine, with the same version of IDL and Java it crashed after aprox. the same number of queries to DB. The problem is very strange, it crashed when try to create a JDBC connection (and no exception are catched, simply crash hotspot).

I dont' know what problem could exist. The most important differences are:

- Version of Mysql, I'm not sure but I think the version isn't the same at work and at clients machine.
- Type of machine. At work I use a single PC (512 MB and one pentium 1.2Ghz) while the clients machine is a dual-core.

Bye.
