Hi Shaldon,

shhhh, calm down, everything will be o.k. some day ... :-) Remember
when you were a kid, strolling around with your scooter? Everything
went fine, going from A to B was just what you wanted to do, and the
scooter did exactly what you wanted hinm to do? And then your mean
uncle gave you that bicycle. Horror! Going from A to B was now so much
more difficult than it was before. It needed training, training and
more training. And your knees hurt.

Well, in the end, you still use the bike and probably gave up the
scooter.

O.k. just kidding. This is a bad analogy for MATLAB / IDL, especially
as I don't know MATLAB. Please, no flamewar on this issue, now.

But as for the /NODATA, this is good if you, for example, want coloured
plots but black on white axes. Then with the PLOT command and /NODATA
you can establish the environment, i.e. the axes, and then,
subsequently, you can add the coloured lines using OPLOT.

Cheers,

   Peter
