"XROI, kneelmg, REGIONS_OUT = femurROlout, STATISTICS = femurStats"

gives me ROI region from femurROlout selected from user. I can do

"XROI, kneelmg, REGIONS_IN = femurROlout, STATISTICS = tibiaStats" to

define the same region for a different image.

I need statistic data for same region from different images. My question is how I can do this without opening XROI window. Once user defines a ROI, program automatically retrieve the data from the rest.

thanks in advance
