Hi,

I have a program where i need to read in multiple files. Currently i read in 6000 binary files using a function i have written. This reads three columns of data out of each file. To do this i use a loop that calls the function to read a file who's data is then added to an array. At the moment it takes around 90 seconds to go through the 6000 files. Is there any way that i can read this data not using a loop? Or at least are there any tips for speeding this up?

thanks

Clive Cook
