Subject: Force 8bit display ?

Hi everybody

Do you know if it is possible to set the display depth at 8 bit instead of 24bits. I'll try:

IDL> device, /pseudo_color ;but values are always set to default values

By default when I start IDL visual_depth=24, and visual_name=TrueColor and Decomposed=1. I work on a laptop under LINUX debian.

As I'm working mainly with curve plots I'd prefer to have a dynamical color table (which if I understand well is equivalent to PseudoColor and 8bit). I'm trying to understand the color system since this morning and I will continue this afternoon to read my IDL bible (Fanning's book), so my question may be (or not!) obsolete in few hours! but I don't care it's just for the pleaure to ask a question and to hear from you all.

Cheers,

Laurent
