If i am correct with my limited knowledge of IDL, IDLgrView class does not have the draw

method. IDLgrWindow, IDLgrModel, IDLgrBuffer have draw method. Now the question comes that which class's draw method i should override. IDLgrWindow, IDLgrModel or IDLgrBuffer? Where will C dlm render the Left and right image? Will it be on IDL's window or on C's window?

It would be helpful if you can provide sample code or detailed explaination of your suggested technique.

```

What I meant here is that Quad Buffer rendering is also a type of hardware rendering and IDL should automatically detect this.
