> All suggestions gratefully received!

Dave:

This is a definite Bug. I am using Window 3.6.1. Get identical response.
You have probably already found out that:

```
IDL> print,test
c0000.
IDL> print,strpos(test,'0000.') ; a longer search string.
      1
IDL> print,strpos(test,'000.') ; your search string.
     -1
IDL> print,strpos(test,'00.')   ; a shorter search string.
```

3

and also

```
IDL> print,test
c0000X
IDL> print,strpos(test,'000X') ; different terminal character.
-1
```

This is a very scary bug. I can't find the source for strpos.pro in the library so it must be part of the dynamic run executable.

I re-wrote strpos calling it strpos1. It performs as follows:

```
IDL> print,test
c0000.
IDL> print,strpos1(test,'0000.')
1
IDL> print,strpos1(test,'000.')
2
IDL> print,strpos1(test,'00.')
3
IDL> print,strpos1(test,'0.')
4
```

and here is the text of the routine.

```
-----cut here-----
function strpos1,targ,srch,pos
  targ=string(targ)
  srch=string(srch)
  if (n_elements(pos) eq 0) then pos = 0
  t=byte(targ)
  n=n_elements(t)
  m=strlen(srch)
  p=lindgen(m)
  i=pos
  for i=pos,n do begin
    if (srch eq string(t(p+i)))then return,i
  endfor
  return ,-1
end
```

-----end of routine -----

I do not have time to properly document this. RSI really should fix it.

E-mail me if you have questions. I tried to reply directly but the mail was returned (?).
