Subject: Suppressing diagnostic messages en masse
Posted by MarioIncandenza on Fri, 03 Feb 2006 00:45:42 GMT

Hey great minds,

I am engaged in semi-permanent debugging of some pretty long scripts,
which in the course of developing I have peppered with PRINT statements
to achieve various diagnostic ends.

I don't think the script is "final," whatever that means, but it's time
to do some production runs, where the script will be invoked 10,000
times, instead of the usual 1.

I can do a search-and-replace to comment out the diagnostics for this
purpose, but what would really be nice is if I could somehow put a
keyword flag into the routine that, when set, would suppress|promote
the diagnostic messages. Sounds like the sort of thing that might
exist. Anyone know how to do this?
