This should be easy and maybe I am missing the obvious but how to you maximize a base widget programatically? I see how you can iconify/de-iconify but not maximize.

In windows XP there is a slight difference between a maximized widget and a widget that has been sized to the desktop size. I know how to compensate for this the messy, probably wouldn't work for all XP desktop themes way, I was just hoping there would be a "clean" way of doing this.
