Thank you for creating that routine. I have been hoping for a way to shade_surf DEMs, but never explored it much. Ok here in an obvious question for you.

I downloaded a DEM called from USGS called:

mount_mckinley-w.gz

Then unpacked it using: gunzip mount_mckinley-w.gz

Resulting in the binary file: mt_mc_kinley-w

Can you tell me how to associate the contents of this file with the variable 'dem' to be used in your program??

Or have I done something wrong?

Thanks,
Chris
