Hi Antonio,

I saw the system variable singleton implementation, but what I am in doubt is about the usage of the pattern itself. Since everytime I need a reference to the singleton object in my objects I need to call a `myObject = Singleton()` statement, or initialize an attribute in every object needing a reference to the singleton. But what if I just create a read only system variable and use it over my whole program? (this variable would be an instance of my "singleton" class)

Thanks

Vinicius
