
Subject: Colors with XOR plotting

I put this question at the end of a previous message so it may not have been noticed. As a further enhancement to the rubber band effect I would like to be able to get a particular color with XOR set. For example, I would like to be able to plot a red X on a red line and have the X move around on the line in response to the cursor position. Is this possible or does the working of XOR prevent red on red like this? I would also like to put a blue mark on a red line and move the blue mark around.

I guess the bottom line is, how can I choose what color comes out with XOR plotting?
