---

Hi all,

I need a quick advice on the way to write number in the exponent format  
I want.

For example, I want the number printed on my screen in the following  
form

-2.3435e-5

i.e. 4 digits after the point and as function of e-5

Any suggestion? I have tried to use the format='(EX.X)' but without  
much of a success .... :(
