DXF, Yes, mostly, sort-of. DWG, no.

Check out the docs on IDLffDXF. I've put together an object that simplifies reading DXF files, handling the more mundane tasks of atom creation and cleanup. The one big limitation is that I don't have any dxf files that have any meaningful color information so while there is some code in place to handle color, it is untested. I end up brute forcing the color by getting a list of the primitives after loading the file and coloring them individually via their SetProperty method.
