Hi Mark,

My last post about the compile error doesn't seem to affect me to use the functions in the Motley library, so could be neglected if you like :). But I'm not familiar with the "index space", I didn't find mgh_example_locate2.pro in the library. Are Xin and Yin in mgh_locate2 the index of my lat2 and lon2? how could I get them? could I avoid the ponits of zeros in the meanwhile?

Sorry for these simple questions.

Thanks again,
Jenny
