hello,

I don't know if this will help, but from my own experience has been done in my case.

use ubuntu dapper 5  
downloaded installer for IDL 6.2 from rsi website  
followed installation instructions provided on website

When I did all these steps I had IDL working on the ubuntu system with no errors. I have read on the internet for many people that trying to install with the CD is a mess. This could be a possible solution. I am not sure, but when you download the IDL program from the RSI website you can use your student information into the registration file. In your case though with 6.0 to 6.2 I would imagine you have to upgrade. Good luck!

Eli
