Hi guys!

The first public snapshot of Fawltly Language, an IDL compatible compiler is available. (IDL is a registered trademark of Research Systems Inc.)

FL binaries can be freely used and downloaded from the homepage

<http://web.interware.hu/fl>

Available packages:

fl_0.6-i686-linux.tar.gz (Linux, Pentium II,
kernel 2.4/2.6, glibc >= 2.2.5)

fl_0.6-amd64-linux.tar.gz (Linux, AMD Athlon64,
kernel 2.6, glibc >= 2.3.3)

and for the bravehearted:

fl_0.6-i686-mingw.zip (Windows 2000/XP/?, Pentium II)

Features:

- all language elements are supported
- multithreaded operators
- array operations use MMX/SSE/SSE2, if available
- module profiling
- line profiling
- about 280 library functions (more or less usable)
- true-color (24 bit) direct graphics devices: X, WIN, PS, PDF, Z
- run-time performance: for many programs, FL is faster than IDL
(eg. the empty loop is three times faster in FL :-)

Enjoy!

fl
(Földy Lajos)

ps: Hungarian names are in reverse order. Wait, no! English names are in reverse order :-). So my name is Lajos Foldy in English.
