Cc'd to jepear@essex.ac.uk

You'll need to create a temporary variable to hold the data being read and then store that temporary data into the struct. A "feature" in the way WAVE handles structure tags is that they cannot get assigned directly from a function call keyword (also true for IDL).

Something along the lines of this ought to work:

```
tdata = intarr(2, /nozero)
data = intarr(2, 400, /nozero)
openr, lun, file, /get_lun
for i = 0, 399 do begin
  readu, lun, tdata
  data(*,i) = tdata
endfor
```
