Subject: passing IDL string to Fortran90?

Hi, Folk

I've been using quite often with `call_external()` to let F90 do the number crunching. And I'm happy to see it speeds my data processing quite a lot. Recently I found that F90 loads binary data from file 3~4 times faster than IDL. However it seems clueless to me how to pass a IDL string to Fortran90. Can anybody here give me some hints? Thanks a lot!
