Would anybody happen to know what is the easiest way in IDL to create animations in the form of mpeg or avi files from a series of still images in png, jpg or other format. I see there are some licensing issues where you have to pay money for an extra licence to make mpeg files. Is there perhaps some other software package that dosnt cost too much that can make the animations from the still images, which could then be run on say windows media player or other commonly used player.

Thank you,
Neil
