IDL-X Window System problem: setting mouse actions.

I have following problem: In an IDL program (on HP) I use the SPAWN-command to start a C-program. This C-program uses X Toolkit Intrinsics. I have tried to set the mouse actions with the action/translation table procedures or the XtAddEventHandler procedure. Both ignore/don't execute the wanted actions.

I want to set the actions of my mouse input of my X Window System program which is started by IDL (both communicate through a pipe during execution). Does someone have an idea on solving this problem ???

Please use e-mail to respond: [debruin@mpi.nl](mailto:debruin@mpi.nl)

Thanks for any suggestions, Rene.
