Thanks everyone for your quick responses. I was using a script (@script), but I wanted to use the .reset_session command many times. Here was a piece of my code:

```
for i=0, size(int_arr, /n_elements)-1 do begin .reset_session &  
map_to_geo & endfor
```

So, the .reset_session command could be used in the script, just not within an IDL statement. It would have worked if I only wanted to reset the session once.

I just realized that all of my structures were named, so this problem can be solved if I just make all of my structures anonymous.

OK, I made all the structure anonymous and I am running the code right now.....

And it works!

Thanks for the help everyone,
Branch
