Phillip,

Perhaps this might be better.

Remove the button_uValue, and insert /Return_Name

```
numCCDID = CW_BGROUP(tabAngID,['1','2(Default)'],$  
                        /exclusive,set_value=1,$
```

```
uvalue='numofCCDs',/no_release,/frame,/return_name)
```

Then your Case statement can select on event.value as either '1' or
'2(Default)'

It's almost a case of CW_BGroup being over-optioned...

Andrew
