
Subject: iplot and color tables?

Hi!

I can't seem to find a way to use simple color tables in iPlot, like it is possible to do in iimage.

Do I really have to know the RGB values of useful colors for iPlot's COLOR keyword, just to distinguish 10 graphs I overplot on each other, or do I overlook something?

If giving the color in RGB values is really the only way to have nicely distinguishable graphs in iPlot, does anybody happen to have a list of let's say, 16 different RGB values for that?

I see, that there is a way to construct your own color table.. but.. do I really have to? :)

I'm a scientist, who does not necessarily want to know about RGB values of useful colors, but just wants to have different plots nicely distinguished by colors.

In PLOT I just can multiply/add my FOR-variable to change the value for the color keyword, but in iPlot? Any suggestions?

Many thanks in advance,
Michael
