OK, IDL gurus, here's another question for you.

I have created (with help from this news group and a couple of David Fanning's procedures) a GUI for a program that maps out data on map projection. It works great if I run it from IDL; nice color pic and the such.

Problem I encounter is when I save it with IDL's save procedure, and run the program in IDL VM. I get a black and white pic. That is, until I mouse over a widget_draw widget. Then I get colors all over the place; the correct colors are in the draw widget, but I also get a skewing of colors elsewhere on the monitor.

I'm sure I didn't include quite enough info, but I'm hoping this is a (somewhat) common problem that somebody has encountered before with some fix that I've overlooked.

Any ideas?
