Hi All,

does anyone know how to convert a string to a structure tag? for e. g.
I'd like to take a string as a function argument and use it to access a
structure tag like so (hypothetically):

```
function example,tag,i,j
```

```
restore,'struct.dat
```

```
tmp=mk_struct_tag(struct(i),tag) ; i.e. tmp=struct(i).tag
```

```
a=tmp(j) ; i.e. a=struct(i).tag(j)
```

```
return a
```

```
end
```

```
thanks,  
KL
```
