Hi,

I have created som binary files using python and tried to read them with IDL. I used the binary_template as well but IDL completely misinterprets the data and returns wrong values and values that were never written in the file. Now Matlab is able to read these files without problem. My question is why is IDL failing to do this? I know that the binaries are Float32 and the dimensions are correct. I am doing something wrong?

Sincerely,
Sheldon
