(Craig M.,)

I'm having trouble figuring out how to use the functargs keyword to mpfitexpr.

In particular, how do I "retrieve" the values from within "myfunct"?  
Your documentation mentions "PRIVATE"?

This is what I \_think\_ it should be:

```
function myfunct, x, p, other=other
  ;; calculate y using x, p, and other
  return, y
end

pro mainpro, data

  ....
  other = read_somewhat_fixed_data(af)
  f = {other:other}
  pout = mpfitexpr('myfunct',x,data,err,p,parinfo=parinfo,functargs=f )

  return
end
```
