Subject: color mis-match between screen and ps (mac os x, tiger 10.4.7)

Hello:

I've just encountered a weird IDL behavior: multi-color line plots that
appear fine on the screen are screwed up when written to the PS device.
I've used these routines for years without problems. Has anyone seen
anything funny using mac os x, 10.4.7 and IDL 6.3? (it reminds me of
the old problems requiring specification of decomposed, pseudo, etc,
but I can't find anything obvious to fix it).

Thanks in advance, Pete Riley
