Hi everybody, I use IDL 6.0 with Debian GNU/Linux. Today after trying to load a color palette to draw several maps, I have noticed that the palette is not loaded.

I use:

device, decomposed=0

xloadct (and then I choose the palette or loadct, 41 -- the number of the palette)

It happens with all the palettes.

I guess that it is related with the X server. Perhaps it is a consequence of a recent update from Debian Sarge to Etch, which has changed my Xserver (in Sarge it was XFree86 and now in Etch is Xorg).

Does anybody know a solution to force IDL to load the palettes?
