Subject: More OO jargon

I have recently published some of my frequently used base classes which are a part of my Nuclear Medicine software project (NMTK).

NMTK Atom Tree:

This is a factory class which manages a set of IDL graphics objects.

NMTK Control:

This is an alternative to using conventional OO event handlers.

I consider this class to be more useful than xmanager because it has

better support for multiple controls within the same UI. It's still

incomplete because I'm hunting around to steal someones data model.

Feel free to tack on your own data model.

Source code is available at

<http://www.barnett.id.au/idl>

Robbie
