
Subject: IDL_IDLBridge in Virtual Machine

I would like to know whether or not the IDL_IDLBridge object is useful for VM programs. The program I am working on will be used by people with only the VM, and it would be very nice to do some computations in the background.

The IDL documentation doesn't seem to say whether it will work or not. A thread about IDL 6.3 changes on this board in May suggests it will not work because of the disabled 'execute'. Then I compiled the idlbridge_demo.pro example to a .sav file and here it works using the virtual machine. But does it only work because I have a licensed copy of IDL on this computer also?

I would appreciate some clarification on whether or not I can expect the IDL_IDLBridge::Execute method to operate on computers with only the IDL VM.

Thanks, Pete
