This should delete all open windows:

```
IDL> while !D.WINDOW ne -1 do wdelete
```

if you know the window indices of the four windows your program creates, you can do:

```
IDL> wdelete, w_ind1, w_ind2, w_ind3, w_ind4
```

where w_ind1, w_ind2, ... correspond to the window indices of your open windows.

Hope that helps,

--Mike
